

Overview of AMLocaliser™

MultiLingual Support Software

AMLocaliser provide multi language support to software application developed using Microsoft technologies. It helps to make the translation of software applications to other languages.

AMLocalizer extracts all the user visible string resources in an application, properties of components on the forms and resource string constants. These will be displayed to the translator in easy to use interface. After editing, these resources will be injected back to the original binary file. Support for additional languages can be added without recompiling the project. Even the end user can do translation.

Features

- ?? Many supported languages with one EXE file. Additional languages can be added without recompilation.
- ?? Easy switching between locale language and English.
- ?? Save the translations and reuse them at later time.
- ?? Translated database can be used in another location.
- ?? Can be distributed to end user that allows separation of the development process from the translation;

- ?? Minimum addition of code or does not require it at all and so size of the application does not actually grow.
- ?? Support for multiple binaries.

Software pre-requisites

AMLocalizer uses Microsoft Access as database and Access should be installed in the target machine.

About NeST

NeST is a global software solutions and application development Company with strong domain knowledge of Industry Automation, Real-Time Systems, Embedded Systems, Consumer Electronics, Avionics, Healthcare, Broadband and Networking & Telecom industry segments. NeST provides total solutions to Hi-tech industries right from hardware designing to integrated software application development. NeST is certified at ISO 9001 and was the 19th company globally to be assessed at SEI CMM Level 5. NeST approach to quality has been continued with initiatives in CMMI and Six-Sigma techniques.
